

Cannot OS Update via Vendor FOTA in Closed Network

ISSUE

Cannot OS update via Vendor FOTA in Closed Network

RESOLUTION

It is possible to update the OS with the FOTA package in not only provisioning level but deployment level.

• In Provisioning Level

1

Execute Scan2Stage console and go to OS Update

2

Upload FOTA Package(PFU file) in closed network or embedded web server

Get Link Address with Embedded web server, Mongoose

A screenshot of a web browser displaying a directory listing. The table has columns 'Name', 'Modified', and 'Size'. The 'mongoose-6.5' link is highlighted, and a context menu is open over it. The 'Copy link address' option is selected and highlighted with a red box.

Name	Modified	Size
08CodeGenScan2Set_v2.5.1.1	14-Jan-2020 11:45	[DIRECTORY]
Scan2Stage_MockStation_Tool	26-Feb-2020 04:07	[DIRECTORY]
85_04_01_20191104_PFI	04-Nov-2019 13:18	KB, MB
mongoose-6.5		

1. Run Mongoose execution file(.exe)
2. Copy the PFU file to web server folder
3. Right click the PFU file, click Copy link address

3

Add the Package link address to Download URL in Scan2Stage console

1. Input target OS version to Version input box
2. Add PFU file address to Download URL

4

Save as JSON file and Generate QR Code via [QR Code generator](#)

5

Read QR Code with your device to update the system

- In Deployment Level(Silent OS Update)

There are two methods which can be used in deployment level, Using Schedule feature or Using intent.

Use Schedule

'Sync Schedule with Server' feature in Scan2Stage makes the device run promised tasks on a specific day of every week.

You can put the OS update action on schedule for checking the device's OS version and updating the OS what if the newer version exists.

You must set the schedule when you save the JSON script file for provisioning the devices via Scan2Stage.

After provisioning, the devices will get the server's JSON script file periodically in time you set.

How to set the Schedule?

Make JSON Script file containing OS update task and Upload it to your server.

When you have some updates for the task, simply edit the file.

1

Execute Scan2Stage console and Navigate to Schedule

2

Check 'Sync schedule with server' to apply the JSON script file on a specific day of every week.

3

Set the days&time that And then, input the URL of the JSON file containing OS update task.

Use Intent

#02: Using intent on Custom application

You can use intent on the custom application for OS Update by inputting the string in Extra parameter as same as reading QR Code.
But, because It requires to edit the custom application, please open the ticket to request for additional progress.
