Send barcode data with Clipboard type through RDP

APPLIES TO

All devices running Android 7 and above

RDP with Clipboard type

You usually use Keyboard wedge or Clipboard type among the result type when you send barcode data through RDP(Remote Desktop Protocol).

Clipboard type is faster if the amount of data is large because the clipboard type uses copy&paste action for input data.

But because the key code for paste action is added from Android 7(API 24), you can use clipboard type with the devices running Android 7 and above.
